ADDENDUM NUMBER ONE

DUPONT PUMP STATION AND BASIN IMPROVEMENTS – PHASE 2 (Contract A) W-12-026-202

CITY OF CHATTANOOGA, TENNESSEE

The Bid Date shall be extended to Thursday, December 19, 2019 at 2:00 PM. The cutoff for questions shall be extended to December 12, 2019.

The following changes shall be made to the Contract Documents, Specifications, and Drawings:

I. CONTRACT DOCUMENT

- A copy of the sign-in sheet from the Pre-Bid meeting on November 21, 2019 is attached.
- Add attached Drawings C-17, C-18, C-19, C-20, and CD-8.
- Add attached Specification Section 13 60 13 Pre-Fabricated Restroom
- Replace Section 00 41 00 Bid Form with the attached.
- Drawing C-1: Revise Laydown Area Label "Contractor Laydown Area 60'x175"
- Drawing C-4: Revise RCP Label "12" RCP" for both stormwater pipelines located between the new catch basins and new concrete headwall.
- Add Wilo and Ebara to the list of acceptable submersible solids handling pump manufacturers. Product shall meet the detailed requirements of the specifications.
- Add Lord and Company to the list of acceptable PCSS in Section 40 90 00.
- Replace paragraph 2.03.D in Section 43 21 39 with the following paragraph:

The impeller shall be a rotodynamic semi-open, solids handling type capable of passing solids either due to internal clearances or other features to facilitate solids processing including a wear plate with groove. The wear plate to impeller clearance shall be easily adjustable without the need for disassembly of the pump or the need to add or remove shims. The impeller may include pump out vanes on the upper shroud to reduce axial thrust and minimize clogging due to debris accumulation around the mechanical seal. As an alternate, the impeller may be a rotodynamic enclosed, solids handling type, capable of passing fibrous material and three-inch (minimum) diameter solids with a Type 316 stainless steel wear ring fitted to the impeller front shroud. The impeller shall be two-plane dynamically balanced in accordance with ISO 1940-1 quality grade G2.5 standard to provide smooth, vibration free operation.

II. Q&A/COMMENTS

Note: Duplicate questions were provided by several potential bidders. While wording varied slightly, duplicates have been removed.

1. Can you provide the CAD/DWG files for the above referenced job?

Response: CAD files will be made available to the successful bidder.

2. Invitation to Bid - Please provide bid date extension for this project.

Response: The bid date has been revised.

3. Plan Sheet C-6, Note 3: Can you confirm that the 4" Gate Valve is to be Type GV400 per Spec Section 40 05 50-2.05-C-3.e.?

Response: Confirmed

4. Plan Sheet M-7: Can you confirm that the 4" Gate Valve GV-2030 is to be Type GV401 per Spec Section 40 05 50-2.05-C.3.f.? Also is this electric actuator Open/Close or modulating? I did not find this valve on the P&ID drawings.

Response: Confirmed. This valve shall have an Open/Close electric actuator as shown on I-5.

5. It was mentioned the Geotechnical Report will be included with Addendum 1. Is it possible to receive the Geotech Report on 11/26/2019? The cutoff for questions is 12/1/2019 and for most, the last working day before the question cutoff date is 11/27/2019. It is likely that more questions will arise upon receipt of the Geotech Report. Another option would be extending the question cutoff date.

Response: The Geotechnical Report prepared by CDM Smith is attached. Contractors may rely on the data presented in this report. However, reliance on any interpretations of such data are at the Contractor's sole risk. The Bid Date has been revised in Addendum No. 1.

6. Will there be any City provided equipment?

Response: No.

7. Are there any contaminated soils?

Response: Not to our knowledge; however, no specific sampling or testing has taken place.

8. How will pipelines be abandoned?

Response: Pipelines abandoned in place (not removed) will be filled with flowable fill per Specification Section 03 60 00 Grout.

9. Will the project have an inspector?

Response: Yes, the project will have a CDM Smith inspector.

10. What are the noise limitations for the project?

Response: Noise limitations are included in Section 01 13 10 Special Provisions.

11. Will this project have an escrow account?

Response: Yes, per Section 00 86 00 Escrow Agreement.

AD1-2 C05034

12. Can the project have a Geotechnical Allowance?

Response: The project does not currently have a Geotechnical Allowance but does have an allowance for materials testing.

13. The Bid Form text only refers to Bid Items 1 through 6, but includes 7 Bid Items; please advise.

Response: A corrected Bid Form is included in Addendum No. 1.

14. C-1 calls for a 60'-150' Laydown area and C-3 calls for a 60'x175'. Which one is correct?

Response: The laydown area is 60'x175'. See Addendum No. 1 revision.

15. C-4 calls for 15" RCP and C-6 calls for 12" RCP. Which one is correct?

Response: 12" RCP is the correct size. See Addendum No. 1 revision.

16. Please confirm that MH 1 has a vent and a watertight lid.

Response: Confirmed.

17. Can we close a portion of Dixie Drive (just north of the project site) for the duration of the construction project?

Response: This is considered acceptable, provided emergency access is provided and all requirements in 01 12 16 Sequence of Construction are met.

The following questions were also received. Responses are still being developed and will be provided in a separate addendum.

- 1. If we are to provide a design as part of our scope, we request the loading information. If we are to bid to the stamped set of plans provided, then we'd request a more common Micropile diameter of 9.625" x 0.545" be utilized and request the rock bond diameter to be drilled.
- 2. A detailed Micropile geometry was provided in the form of 9.75" x 0.5" piles with a full length 1.5" GR 75 bar and topped with 10"x10"x1" plates with a 7' rock bond length for all piles. No mention of a hole diameter required per their design is provided.
- 3. The specifications say that we have to provide a stamped set of drawings and calculation package for the design of the piles. No loading information (compression, tension, nor lateral) was provided for the piles to be designed to.
- Installation of Manhole MH-A. (Maximum bypass flow = 30 mgd),
 Can you please confirm that 30 MGD is the MANDATORY bypass pumping design for the 30" SS line?
- 5. Installation of 30" force main aerial crossing and associated connections. Bypass pumping is not required, but a 30" temporary HDPE bypass connection may be necessary depending on the amount of time the 30" force main is to be out of service.

- 1. What is the TDH' or PSI on the existing 30" FM
- 2. What MGD flows through this 30" FM?
- 3. Can the flows from 30" FM be discharged into existing 42" gravity line?
- 6. Installation of 42" Gravity Sewer Line West of the proposed aerial crossing will conflict with existing 18" Gravity Sewer. (Maximum bypass flow = 4 mgd)
 - 1. Can you please confirm that 4 MGD is the MANDATORY bypass pumping design for the 18" SS line?
- 7. Installation of Manhole M-7 (replacement of S11K005). (Maximum bypass flow = 4 mgd) 1. Can you please confirm that 4 MGD is the MANDATORY bypass pumping design for the 15" SS line?
- 8. Reference drawing C-6. Concerning the tie in of the new 30" FM-DI into the existing 30" FM, what are the dry weather and wet weather flows in the existing 30" FM? Also, can the flows be controlled without the use of bypass pumps to make this tie in? When the 30" line is cut to make the tie in, how much sewer can be expected to flow into the tie in area?

December 3, 2019	Justin C Holland, Administrator City of Chattanooga

AD1-4 C05034

PRE-BID CONFERENCE MEETING MINUTES

Dupont Pump Station and Basin Improvements – Phase 2 (Contract A) CONTRACT #W-12-026-202

November 21, 2019

Training Facility, Moccasin Bend Wastewater Treatment Plant

1. Introductions

- a. Owner City of Chattanooga
- b. Program Manager Jacobs
- c. Engineer CDM Smith
- d. TDEC State Revolving Fund
- e. Southwest Tennessee Development District

2. Project Scope/Description

- a. The Project location is on Dixie Drive in Rivermont Park and immediately south of the Champions Tennis Club. The Project generally consists of constructing a diversion structure, 22 million gallon per day wet-weather pump station, electrical building, diesel generator, odor control systems for the new structures, yard piping, and related work.
- b. Via addendum, a precast restroom and floating dock repairs will be added to the project.

3. Pre-Bid Conference Agenda

4. Bid Documents

- a. Refer to Section 00 21 13 Instructions to Bidders
- b. Purchase Bids from 8:00 a.m. to 4:30 p.m., Monday through Friday, at the City of Chattanooga Purchasing Department, 101 East 11th Street, Suite G13, Chattanooga, TN 37402, phone (423) 643-7230, fax (423) 643-7244.
- c. Cost of Contract Documents is \$100 per set. No part of the purchase will be refunded for any reason.
- d. Bid Bond in the amount of 5% of Bid with Surety licensed to do business in TN and listed in U.S. Treasury Circular 570.
- e. No Bid withdrawn within 120 calendar days of receipt of Bids.

5. Qualifications

- a. Refer to Section 00 21 13 Instructions to Bidders, and Section 00 45 13 Statement of Bidder's Qualifications
 - i. Bidder shall maintain permanent place of business
 - ii. Must be licensed by State of Tennessee to perform work under contract
 - iii. Bidder shall demonstrate adequate construction experience and sufficient equipment resources to properly perform work.
 - iv. Owner reserves the right to reject any bid if bidder fails to satisfy qualifications.

6. Bidding Requirements

- a. Bid Bond in the amount of 5% of Bid with Surety licensed to do business in TN and listed in U.S. Treasury Circular 570.
- b. No Bid withdrawn within 120 calendar days of receipt of Bids.

c. Section 00 45 77 – Contractor's Identification must be completed, with one copy attached to the outside of the bid package, and one copy inside the bid package.

7. Bidder Questions and Addenda

- a. Use Section 00 21 14 Request for Bidder Information. Submit by fax, email or mail to City of Chattanooga Purchasing Department. bidinfo@chattanooga.gov.
- b. Questions received less than ten (10) days (December 1st, 2019) prior to the date for opening the Bids may not be answered. All questions about the meaning or intent of the Bidding Documents are to be submitted to Owner in writing. Questions and other inquiries shall be submitted to the City of Chattanooga Purchasing Department.
- c. Required to purchase set of plans and specifications to get on the plan holders list. Only bidders on plan holders list will receive addenda; which must be acknowledged in the Bid Form.

8. Bid Opening

- a. Date/Time December 10th, 2019 at 2pm
- b. Location City of Chattanooga Purchasing Department, 101 East 11th Street, Suite G13, Chattanooga, TN 37402

9. Contract Completion Time

- a. Substantial Completion within 300 Calendar Days of Notice to Proceed (Section 00 52 00 will be corrected via addendum to match Bid Advertisement)
- b. Final Completion within 330 calendar days of Notice to Proceed

10. Liquidated Damages

 \$1,000 for each day after Substantial Completion if work is deemed to not be substantially complete, and \$1,000 for each day after Final Completion if Contractor has not completed the work.

11. Project Specific Requirements

- a. Refer to Section 01 12 16 for Construction Constraints and Proposed Sequence of Construction.
- b. Landscape plan development and landscaping to be provided under Bid Allowance 5.
- c. Contractor to be aware that the Dupont Pump Station and Basin Improvements Phase 2 (Contract B) project will be taking place at the same time.

12. Site Access

- a. All work to be completed shall be on the City of Chattanooga's property or easements.
- b. If needed, the Contractor is responsible for acquiring all required right of entry and temporary construction easements on private properties in order to access existing sewers and preform the required work.
- c. Emergency access shall always be maintained to the boat ramp and Champions Tennis Club.
- d. Golf cart shuttle service shall be provided for weekend tournaments (see additional requirements in Section 01 12 16)

13. Safety

a. Refer to Section 00 72 00 and 00 73 00 General Conditions

14. Work Hours

a. Work Hour Restrictions – Work hours shall be 7:00 a.m. to 6:00 p.m. Monday through Friday unless the City has more specific restrictions.

15. DAVIS-BACON Act

a. This project is being funded by a State Revolving Fund loan on or after 2010 EPA Fiscal Year. The loan recipient must be in compliance with all applicable requirements of the Davis-Bacon Act. Gina Ogle – Administrative Assistant, Southeast Tennessee Development District gogle@sedev.org

16. Allowances

a. The Contractor shall include in the Bid Total all allowances stated in the Contract Documents. These allowances shall cover the net cost of the services provided.

17. Other Items

- a. It is the Contractors responsibility to repair any existing utilities that are damaged during construction.
- b. The items discussed here today are not intended to be all-inclusive. It is the Contractor's responsibility to review the Contract Documents and comply with all provisions.

18. Questions

All questions included in Addendum No. 1.

REPLACE EXISTING 8'x8' CONCRETE FLOATS

DRAWINGS AND SHALL NOTIFY THE ENGINEER

AND ASSOCIATED TIMBER (TYP OF 8). CONTRACTOR SHALL FIELD VERIFY ALL

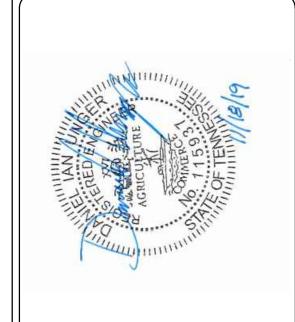

DIMENSIONS PRIOR TO SUBMITTING SHOP

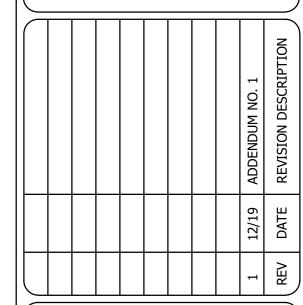

CONCRETE FLOATING DOCK MODIFICATIONS

NOTES:

- 1. CONTRACTOR SHALL FURNISH ALL TOOLS, EQUIPMENT, MATERIALS, AND SUPPLIES AND SHALL PERFORM ALL LABOR, SUPERVISION, FABRICATION, ASSEMBLY, AND DELIVERY OF A COMPLETE CONCRETE FLOAT SYSTEM.
- 2. THE REPLACEMENT DOCK SYSTEM SHALL CONSIST OF MODULAR SECTIONS MATCHING THE DIMENSIONS OF THE EXISTING SYSTEM.
- 3. FLOATS SHALL BE CAPABLE OF SUPPORTING A LIVE LOAD OF 50 POUNDS PER SQUARE INCH WITH A MINIMUM FREEBOARD OF 8".
- 4. WALKING SURFACE OF CONCRETE FLOATS SHALL BE LEVEL AND FLUSH WITH RESPECT TO ADJACENT FLOATS.
- FLOATS SHALL BE DESIGNED TO FLOAT LEVEL UNDER DEAD LOAD.
- FLOAT AND ANCHORAGE SYSTEM SHALL BE DESIGNED FOR THE FOLLOWING LOAD CASES:
- 6.1. WIND PRESSURE 15 PSF (77 MPH AT 33 FEET STANDARD ELEVATION, EXPOSURE C, PER ASCE 7-93) ACTING ON THE PROJECT AREA.
- MINIMUM CURRENT PRESSURE OF 0.6 PSF. 6.3. VERTICAL WAVE LOADS FROM A 1' HIGH 1.5 SECOND PERIOD WAVE.
- 7. PRIOR TO FABRICATION OR CONSTRUCTION, THE CONTRACTOR SHALL FURNISH SHOP DRAWINGS AND CALCULATIONS. CALCULATIONS SHALL BE PERFORMED BY A REGISTERED PROFESSIONAL ENGINEER (STATE OF TENNESSEE). SHOP DRAWINGS SHALL INCLUDE THE REPLACEMENT DOCK SYSTEM, LAYOUT OR MOORING/ACNHORING SYSTEM, DETAILS OF ALL CONNECTIONS, AND ALL OTHER DETAILS NECESSARY TO THE CONSTRUCTION OF THE REPLACEMENT FLOATING DOCK SYSTEM.
- 8. FLOAT MANUFACTURER SHALL HAVE A MINIMUM OF 10 YEARS EXPERIENCE IN THE DESIGN AND MANUFACTURING OF CONCRETE FLOATS.
- 9. FLOATS SHALL BE CAST MONOLITHICALLY IN A SINGLE POUR.
- 10. PRIOR TO THE MANUFACTURING OF FLOATS, THE CONCRETE MIX DESIGN SHALL BE APPROVED. THE CONCRETE MIX SHALL CONTAIN TYPE I OR TYPE II MODIFIED, LOW ALKALI PORTLAND CEMENT. CONCRETE FOR THE TOP SURFACE SHALL CONTAIN POLYPROPYLENE FIBROUS REINFORCEMENT. CONCRETE SHALL HAVE A MINIMUM 28 DAY COMPRESSIVE STRENGTH OF 4,000 PSI PER ASTM C-94. COARSE AND FINE AGGREGATES SHALL CONFORM TO ASTM C-33-86M ASTM C-330 LIGHTWEIGHT AGGREGATES IN STRUCTURAL CONCRETE. ALL CONCRETE SHALL BE AIR-ENTRAINED FROM 5 TO 8 PERCENT AND SHALL BE TESTED IN ACCORDANCE WITH ASTM C-138, C-173, OR C-231. WATER CEMENT RATIO SHALL NOT EXCEED 0.45. SLUMP RANGE SHALL BE 3 TO 7 INCHES WHEN TESTED IN ACCORDANCE WITH ASTM C-143-78. THE CONCRETE UNIT WEIGHT SHALL NOT EXCEED 120 PCF.
- 11. GALVANIZED WELDED WIRE USED AS CONCRETE REINFORCEMENT SHALL BE A MINIMUM SIZE OF 2"X2" - 14/14 AND SHALL MEET ASTM A-185. REINFORCING SHALL BE GRADE 60, CONFIRM TO ASTM 615, AND SHALL BE EPOXY COATED IN ACCORDANCE WITH ASTM A775.
- 12. THE FLOATS SHALL CONTAIN AND EXPANDED POLYSTYRENE CORE (TYPE I) AND SHALL CONFORM TO ASTM C-578.
- 13. THE FLOAT DECK SURFACE SHALL BE TOWEL FINISHED AND SHALL HAVE A
- SLIP-RESISTANT FINISH APPLIED. 14. REPLACEMENT TIMBER SHALL BE PRESSURE TREATED WITH CCA, ACQ, OR ACZA TO 0.6 PCF RETENTION.
- 15. ALL HARDWARE SHALL BE 316 SS AND ALL STRUCTURAL STEEL REQUIRED FOR REPLACEMENT FLOAT INSTALLATION SHALL BE HOT DIPPED GALVANIZED.

LONG WHEN PLOTTED FULL SCALE THIS DRAWING MUST BE USED IN CONJUNCTION WITH THE APPLICABLE OR GOVERNING TECHNICAL SPECIFICATIONS AND OTHER CONTRACT DOCUMENTS.

RESTROOM CIVIL DETAILS

SHEET CD-8

ISSUED FOR BID

Pre-Fabricated Restroom

PART 1 GENERAL

1.01 SCOPE:

A. Construction and onsite placement of a prefabricated precast concrete restroom building.

1.02 PERFORMANCE REQUIREMENTS

A. Manufacturer

- 1. Manufacturer shall be an NPCA Certified Plant or equal.
- 2. Manufacturer shall have a minimum of 10 years' experience producing, assembling and finishing buildings.
- 3. Acceptable Manufacturers include but are not limited to:
 - Huffcutt Concrete, Inc.,4154 123rd Street, Chippewa Falls, WI 54729
 Phone (715) 723-7446, www.huffcutt.com
 - b. CXT Concrete Buildings,901 N. Highway 77, Hillsboro, TX 76645 Phone (800) 696-5766 x3480, www.cxtinc.com
 - c. Carr Concrete 362 Waverly Road, Williamstown, WV 26187 Phone (304) 464-4441, Fax (304) 464-4013, www.carrconcrete.com
 - d. Or Equal.

B. Structural

1. Refer to Drawing S-1 for all applicable Codes and Design Loads.

C. Design

1. Building shall be designed to meet ADA requirements.

D. Concrete

- 1. Plants for mixing concrete shall conform to ASTM C94.
- Cement conforming to ASTM C150 or C595.
- Concrete mixes proportioned using ACI 211.1
- 4. Coarse and Fine Aggregates conform to ASTM C33.
- Mixing water conforms to ASTM C1602.
- 6. Chemical Admixtures used in concrete conform to ASTM C260(Air Entraining), C494 (Mid and High range Water Reducers), C979 (Color Pigments).
- 7. Compressive strength of Concrete minimum 5000psi at 28 days.

- 8. Maximum water/cement ratio of .45.
- 9. Reinforcing Bars- Deformed Billet Steel meets ASTM 615.
- 10. Steel Bar mats and Welded Wire Reinforcement meets ASTM A184, A185, A497.
- 11. Cold Weather Concrete
 - a. Cold weather concrete placement will be in accordance with ACI 306.
 - b. Concrete will not be placed if ambient temperature is expected to be below 35 degrees Fahrenheit during the curing period unless heat is readily available to maintain the surface temperature of the concrete at least 45 degrees Fahrenheit.
 - c. Materials containing frost or lumps of frozen materials will not be used.

12. Hot Weather Concrete

The temperature of the concrete will not exceed 90 degrees at the time of placement. When the ambient temperature reaches 90 degrees the concrete will be protected with moist covering.

1.03 SUBMITTALS

A. Manufacturer shall provide shop drawings and engineering.

1.04 QUALITY ASSURANCE

- A. Production shall be done in accordance with approved submittals.
- B. Pre-pour and post pour checks shall be completed to insure proper dimensioning, component placement, rebar placement, and architectural finish.
- C. Concrete batches shall be tested daily for:
 - 1. Aggregate moisture
 - 2. Air entrainment
 - Temperature
- D. Yield test and compressive strength cylinders shall be taken at a minimum weekly.

PART 2 PRODUCTS

2.01 MATERIALS

A. Doors and Frames

1. Shall comply with the Steel Door Institute "Recommended Specifications for "Standard Steel Doors and Frames" (SDI-100) and as herein specified. The doors shall be insulated 18 gauge galvanized metal with 16 gauge galvanized

Pre-Fabricated Restroom

frames. Doors and frames shall include one coat of rust inhibitive primer and two finish coats of enamel paint.

B. Door Hardware

- Door Closer: Norton CLP7500T or equal.
- 2. Sweep: Reese 962C Anodized Clear Aluminum, Door Sweep Weather strip Nylon Brush Insert or equal.
- 3. Hinges: 3 Hinges. Ives 3-BB-I-HW-4.5x4.5-US26D-NRP or equal.
- 4. Lockset: Key-in-lever cylindrical locksets shall be Falcon T Series or equal and meet the following requirements:
 - a. All locks shall meet the new ANSI/BHMA A156.2, Series 4000, Grade 1 for key-in-lever locksets.
 - b. Locksets shall be UL Listed (3 hour A Label).
 - c. Locksets shall be provided standard with Pressure Release feature. When outside lever is locked, it is not rigid but will move freely without operating the latch bolt.
 - d. Lever trim shall have individual heavy-duty compression springs behind rose for lever return and to prevent lever sag. Trim shall be through-bolted with two (2) 10-32 screws coated with thread sealant to provide strength and resistance to loosening. Inner and outer trim shall "bottom out" to prevent door collapse. Roses shall be minimum of 3-1/2" diameter.
 - e. All lever designs shall be solid and meet the federal ADA and state disability requirements. Inside levers shall be attached by Allen-head set screw to prevent tampering or vandalism.
 - f. Locksets shall adjust to fit door thickness from 1-3/4" to 2-1/8".
 - g. All Locksets shall be non-handed and not require field disassembly for rehandling.
 - h. Preparation for door must be non-handed.
 - i. Acceptable manufacturer: Falcon Lock T571PD DAN 626 98535 5164 or equal.

C. Plumbing

- 1. Stools
 - Porcelain wall mounted with flush valve.
- Urinals
 - a. Porcelain wall mounted with flush valve.
- Lavatory
 - a. Porcelain wall mounted with faucet.
- 4. Hot Water Heater
 - a. One (1) Electric Instantaneous minimum requirement- 3.2 kW, 110/115V
 1 Phase 60 Hz with 1.5 GPM .

- 5. Piping
 - a. Drain and vent piping shall be schedule 40 PVC.
 - b. Potable water piping shall be PEX tubing,
- 6. Hose Bibb
 - a. Hose Bibb to be installed in plumbing chase.
- 7. ADA Drinking Fountain with Bottle Refiller

D. Electrical

- 1. Interior surface mounted fixtures and conduit.
 - a. Kennel vandal proof light fixtures or equal.
 - b. Motion sensors.
 - c. GFI duplex outlets.
 - d. Single pole switches.
 - e. Water heater connection.
 - f. 12 circuit breaker panel.
 - g. Metallic conduit
- 2. Wall Chase Mounted Electric Hearters
 - a. Fan forced upflow, ETL listed, factory rated at 120V, 208V and dual field rate 208V/240V.
- 3. Restroom Electrical Wall Heater
 - a. Fan forced up flow, UL listed
 - b. Factory rated 208V
 - c. Dual field rate 208V/240V
- 4. Exterior
 - a. 100 Wall HPS wall pack with photo eye control or equal.
- 5. Electric Wall Mounted Hand Dryers- Xlerator Model No. XL-SB
- 6. Exhaust Fan System
- E. Floor Vents
 - 1. Shall be 16" x 8" made from cast aluminum alloy louvered, with rodent proof screen riveted in.
- F. Toilet Paper Dispensers
- G. Frame shall be made from 18 gauge, type 304 stainless steel. Tube shall be 20 gauge, 11/8" diameter stainless steel equipped with a padlock. Toilet paper dispenser shall hold 3 rolls of paper. Acceptable manufacturer: Royce Rolls Ringer Company TP-3 or equal.

Pre-Fabricated Restroom

H. Grab Bars

1. Grab bars shall be 1½" O.D. heavy duty stainless steel with concealed mounting. Tubing shall be 18 gauge seamless construction with exposed surfaces in architectural satin finish. Flanges shall be 13 gauge stainless steel and escutcheons 22 gauge. Each ADA accessible stall shall have (1) 18" vertical, (1) 42" horizontal, and (1) 36" horizontal grab bar. Acceptable manufacturer: Bradley 8120-001 or equal.

Mirrors

1. Mirrors shall be durable, sturdy, type 304 stainless steel 18 gauge frame w/satin finish. The mirror shall be A float glass with electro-copper-plated silver back or polished stainless steel. Acceptable manufacturer: Royce Rolls Ringer Company TM1836 or equal.

J. Soap Dispenser

1. Soap dispenser shall be stainless steel. Acceptable manufacturer: Royce Rolls Ringer Company LSV or equal.

K. Paper Towel and Bin

1. Paper towel and bin shall be stainless steel. Acceptable manufacturer: Royce Rolls Ringer Company L-SYSTEM or equal.

L. Sealers

1. Floor shall be sealed using a deep penetrating, high alkali resistant, low volatility product. Acceptable manufacturer: TK Products 290 or equal.

M. Caulks and Grout

- 1. All joints between precast panels shall be caulked using a durable, flexible polyurethane sealant. Acceptable manufacturer: Tremco Dymonic FC or equal.
- 2. Grouts shall comply with ASTM C-387 and ASTM C-928 R2 and contain no calcium chloride or other added chlorides that contribute to reinforcement steel corrosion. Grout shall not contain any gypsum-based components.
- N. Fold Down Changing Station

2.02 FINISHES

A. Interior

1. Smooth trowel finish.

Pre-Fabricated Restroom

B. Exterior

- 1. Wall panels shall be Ashlar Stone or equal on bottom 3' with Weathered Tongue & Groove or equal on top.
- 2. Roof shall be simulated cedar shake appearance.

C. Paint

1. Interior

a. Wall panels shall be primed with premium quality water based acrylic multipurpose bonding primer moisture and alkali resistant up to 13.0 pH. ICI Paints or equal. Finish coat shall be high performance acrylic semigloss enamel. Acceptable manufacturer: Devoe High Performance Devflex Coating or equal.

2. Exterior

- a. Roof shall be covered with a quality 100% acrylic satin paint. Acceptable manufacturer: Hallman Lindsay Weatherguard 100% Acrylic Satin 172 or equal.
- b. Wall panels shall be covered with a quality concrete stain. Acceptable manufacturer: H&C Concrete Stain Water Based or equal.

3. Doors

4. Metal surfaces both interior and exterior shall be covered using a high performance 100% acrylic satin enamel. Acceptable manufacturer: Hallman Lindsay Duratech 100% Acrylic Satin Enamel or equal.

PART 3 EXECUTION

3.01 INSTALLATION

A. Placement:

- 1. Building should be placed to accommodate ADA requirements for access.
- 2. Delivery and setting at the site and access to the site require clearance for a truck carrying pre-fabricated building and a crane. The access area must have a minimum height of 14' 6' and a minimum width of 14'. It must also be able to accommodate a 78' vehicle and its increased turning radius. The site must be able to have both the crane and the truck carrying the pre-fabricated building in it at the same time.

B. Excavation

1. Finished floor height shall be 6 inches above finished grade considering surrounding elevations, ADA accessibility, rain water runoff, and other site specific criteria.

END OF SECTION

Bid Form

DUPONT PUMP STATION AND BASIN IMPROVEMENTS – PHASE 2 (CONTRACT A) CONTRACT NUMBER W-12-026-202

ARTICLE 1 – BID RECIPIENT

1.01 This Bid is submitted to:

City of Chattanooga, Tennessee Purchasing Department 101 E. 11th Street, Suite G13 Chattanooga, TN 37402

1.02 The undersigned Bidder proposes and agrees, if this Bid is accepted, to enter into an Agreement with Owner in the form included in the Bidding Documents to perform all Work as specified or indicated in the Bidding Documents for the prices and within the times indicated in this Bid and in accordance with the other terms and conditions of the Bidding Documents.

ARTICLE 2 – BIDDER'S ACKNOWLEDGEMENTS

2.01 Bidder accepts all of the terms and conditions of the Instructions to Bidders, including without limitation those dealing with the disposition of Bid security. This Bid will remain subject to acceptance for period of time after the Bid opening as stated in the Advertisement for Bids, or for such longer period of time that Bidder may agree to in writing upon request of Owner.

ARTICLE 3 – BIDDER'S REPRESENTATIONS

- 3.01 In submitting this Bid, Bidder represents that:
 - A. Bidder has examined and carefully studied the Bidding Documents, the other related data identified in the Bidding Documents, and the following Addenda, receipt of which is hereby acknowledged.

Addendum No.	Addendum Date

- B. Bidder has visited the Site and become familiar with and is satisfied as to the general, local and Site conditions that may affect cost, progress, and performance of the Work.
- C. Bidder is familiar with and is satisfied as to all federal, state and local Laws and Regulations that may affect cost, progress and performance of the Work.
- D. Bidder has carefully studied all: (1) reports of explorations and tests of subsurface conditions at or contiguous to the Site and all drawings of physical conditions relating to existing surface or subsurface structures at the Site (except Underground Facilities)

that have been identified in SC-4.02 as containing reliable "technical data," and (2) reports and drawings of Hazardous Environmental Conditions, if any, at the Site that have been identified in SC-4.06 as containing reliable "technical data."

- E. Bidder has considered the information known to Bidder; information commonly known to contractors doing business in the locality of the Site; information and observations obtained from visits to the Site; the Bidding Documents; and the Site-related reports and drawings identified in the Bidding Documents, with respect to the effect of such information, observations, and documents on (1) the cost, progress, and performance of the Work; (2) the means, methods, techniques, sequences, and procedures of construction to be employed by Bidder, including applying the specific means, methods, techniques, sequences, and procedures of construction expressly required by the Bidding Documents; and (3) Bidder's safety precautions and programs.
- F. Based on the information and observations referred to in Paragraph 3.01.E above, Bidder does not consider that further examinations, investigations, explorations, tests, studies, or data are necessary for the determination of this Bid for performance of the Work at the price(s) bid and within the times required, and in accordance with the other terms and conditions of the Bidding Documents.
- G. Bidder is aware of the general nature of work to be performed by Owner and others at the Site that relates to the Work as indicated in the Bidding Documents.
- H. Bidder has given Engineer written notice of all conflicts, errors, ambiguities, or discrepancies that Bidder has discovered in the Bidding Documents, and the written resolution thereof by Engineer is acceptable to Bidder.
- The Bidding Documents are generally sufficient to indicate and convey understanding of all terms and conditions for the performance of the Work for which this Bid is submitted.
- J. Where this Bid Form contains the provision for a bid based on a lump sum price, the Bidder shall be responsible for having prepared its own estimate of the quantities necessary for the satisfactory completion of the Work specified in these Contract Documents and for having based the lump sum price bid on its estimate of quantities.

ARTICLE 4 - BIDDER'S CERTIFICATION

4.01 Bidder certifies that:

- A. This Bid is genuine and not made in the interest of or on behalf of any undisclosed individual or entity and is not submitted in conformity with any collusive agreement or rules of any group, association, organization, or corporation;
- B. Bidder has not directly or indirectly induced or solicited any other Bidder to submit a false or sham Bid:
- C. Bidder has not solicited or induced any individual or entity to refrain from bidding; and
- D. Bidder has not engaged in corrupt, fraudulent, collusive, or coercive practices in competing for the Contract. For the purposes of this Paragraph 4.01.D:

- 1. "corrupt practice" means the offering, giving, receiving, or soliciting of anything of value likely to influence the action of a public official in the bidding process;
- 2. "fraudulent practice" means an intentional misrepresentation of facts made (a) to influence the bidding process to the detriment of Owner, (b) to establish bid prices at artificial non-competitive levels, or (c) to deprive Owner of the benefits of free and open competition;
- 3. "collusive practice" means a scheme or arrangement between two or more Bidders, with or without the knowledge of Owner, a purpose of which is to establish bid prices at artificial, non-competitive levels; and
- 4. "coercive practice" means harming or threatening to harm, directly or indirectly, persons or their property to influence their participation in the bidding process or affect the execution of the Contract.

ARTICLE 5 - BASIS OF BID

5.01 Bidder will complete the Work in accordance with the Contract Documents for the following price(s):

Item No.	Description	Estimated Quantity	Unit	Unit Price	То	tal Price
Mobiliz	ration / Demobilization					
1	Furnish all products, materials, and equipment and perform all labor necessary to complete and put into operation the DuPont Pump Station and Basin Improvements (Phase 2), including all work shown on the Drawings and per the requirements provided in the Specifications, but not including Bid Items 2 and 3.			\$		
2	Furnish all products, materials, and equipment and perform all labor necessary to complete the <i>precast restroom</i> , including all work shown on the Drawings and per the requirements provided in the Specifications.	Lump Sum		\$		
3	Furnish all products, materials, and equipment and perform all labor necessary to complete the <i>dock repairs</i> , including all work shown on the Drawings and per the requirements provided in the Specifications,	Lump Sum		\$		
Cash All	Cash Allowances					
4 Soil, Concrete and Materials Testing		Al	llowance		\$	40,000
5	5 Construction Verification Surveying Allowance		\$	15,000		
6	6 Permitting Allowance		\$	15,000		
7	7 Landscape Plan Development and Landscaping Allowance		\$	50,000		
8	Connection to Existing Waterline Allowance			\$	30,000	
9	Power Company Allowance	Al	llowance		\$	100,000
			Tota	l Base Bid:	\$	

BID TOTAL, ITEMS 1 THROUGH 9, INCLUSIVE, THE AMOUNT OF		
	DOLLARS (\$).

ARTICLE 6 – TIME OF COMPLETION

- 6.01 Bidder agrees that the Work will be substantially complete and will be completed and ready for final payment in accordance with Paragraph 14.07 of the General Conditions on or before the dates or within the number of calendar days indicated in the Agreement.
- 6.02 Bidder accepts the provisions of the Agreement as to liquidated damages.

ARTICLE 7 - ATTACHMENTS TO THIS BID

- 7.01 The following documents are submitted with and made a condition of this Bid:
 - A. Statement of Bidders Qualifications
 - B. Affidavit of No Collusion by Prime Bidder
 - C. Drug-Free Workplace Affidavit
 - D. Iran Divestment Act Compliance Certification
 - E. Attestation Regarding Personnel Used in Contract Performance
 - F. Certification By Proposed Prime or Subcontractor Regarding Equal Employment Opportunity
 - G. Certification Regarding Debarment, Suspension and Other Responsibility Matters

ARTICLE 8 - DEFINED TERMS

8.01 The terms used in this Bid with initial capital letters have the meanings stated in the Instructions to Bidders, the General Conditions, and the Supplementary Conditions.

ARTICLE 9 - BID SUBMITTAL

9.01	This Bid submitted by:	
An Inc	<u>dividual</u>

Re: Geotechnical Data Report

DuPont Gravity Sewer and Pump Station

DuPont Parkway to Dixie Drive

Chattanooga, Tennessee

Terracon Project No. E2175151

Dear Mr. Unger:

This Geotechnical Data Report documents the results of field and laboratory programs described in the contract documents. Attached find:

- Boring logs with field and laboratory data (Boring Nos.B-101 through B-113; B-201-B-210;
 B-215 and B-216);
- Stratification based on visual soil and rock classification is included on the logs:
- Groundwater levels observed during and at completion of drilling;
- Site Location Plans and Boring Location Plans;
- Subsurface exploration conditions;
- Description of subsurface conditions; and
- Tabulated laboratory results and appendices of laboratory reports.

We appreciate the opportunity to be of continued service to you on this project. Should you have any questions or if we may be of further assistance, please contact us.

Sincerely,

Terracon Consultants, Inc.

John D. Cannon, P.E.

DuPont Gravity Sewer and Pump Station
DuPont Parkway to Dixie Drive
Chattanooga, Tennessee
Terracon Project No. E2175151
October 26, 2018

INTRODUCTION

This data report presents the results of our subsurface exploration for the proposed Gravity sewer and Pump Station project to be located at DuPont Parkway to Dixie Drive in Chattanooga, Tennessee.

The geotechnical engineering scope of services for this project included the advancement of 25 test borings to depths ranging from approximately 15 to 60 feet below existing site grades.

Maps showing the site and boring locations are shown in the **Site Location** and **Exploration Plan** sections, respectively. The results of the laboratory testing performed on soil samples obtained from the site during the field exploration are included on the boring logs and as separate graphs in the **Exploration Results** section of this report.

SITE CONDITIONS

The following description of site conditions is derived from our site visit in association with the field exploration and our review of publicly available geologic and topographic maps.

Item	Description	
Parcel Information The gravity sewer will extend from DuPont Parkway to Dixie Driv Chattanooga, Tennessee. The pump station will be located at ap GPS coordinates 35.0959, -85.2664.		
Existing Improvements	The gravity sewer will follow an existing public easement. The planned alignment is mostly wooded. The pump station will be in an area that is currently partially asphalt-paved and partially grassed.	
Existing Topography	The invert of the gravity sewer will start at approximate elevation 648.7 and end at 645.0.	

DuPont Gravity Sewer and Pump Station ■ Chattanooga, Tennessee October 26, 2018 ■ Terracon Project No. E2175151

PROJECT DESCRIPTION

Our initial understanding of the project was provided in our proposal and was discussed in the project planning stage and our final understanding of the project conditions is as follows:

Item	Description	
Information Provided	Information was provided by Daniel Unger, P.E., with CDM Smith	
Project Description	Gravity Sewer, about 7,000 LF, 48 inches in diameter, including 1 railroad crossing and 1 aerial creek crossing Pump station (20 to 22 feet deep) with an adjacent electrical building, emergency generator, and diversion structure	
Estimated Start of Construction	2019	

GEOTECHNICAL CHARACTERIZATION

Geology

The project site is in the Valley and Ridge, a geologic setting in which parallel valleys and ridges are oriented southwest–northeast. The area is characterized by ancient sedimentary rocks which have been subjected to thrust faulting, resulting in the formation of perpendicular joints – fractures along which there has been little if any movement – with one set oriented southwest-northeast and the other set southeast-northwest. The ridges tend to have a resistant cap of sandstone underlain by limestone, dolomite and shale sequences, similar to those found in the valleys. Limestone and dolomite are carbonate rocks which have an elevated potential to be impacted by weathering and solution activity, especially along joints and bedding planes. Solution activity can result in development of soft soil zones at the soil-rock interface, and weathering of bedrock along joints producing voids, slots (void or soil-filled) or caverns. Soil or rock overlying a void may remain stable due to arching, but when de-stabilized, can result in a surface breach, either a "drop out" or a sinkhole.

The rock formation underlying the site is the Chickamauga Group, a predominantly limestone sequence which may include greenish-gray calcareous shale, shaley limestone and dolomite.

Subsurface Profile

We have developed a general characterization of the subsurface soil and groundwater conditions based upon our review of the data and our understanding of the geologic setting. The following table provides our geotechnical characterization. As noted in **General Comments**, the characterization is based upon widely spaced exploration points across the site, and variations are likely.

DuPont Gravity Sewer and Pump Station ■ Chattanooga, Tennessee October 26, 2018 ■ Terracon Project No. E2175151

Stratum	Approximate Depth to Bottom of Stratum (feet)	Material Description	Consistency/Density/Rock Strength
Surface	0.3 to 0.8	Topsoil or Asphalt pavement and aggregate base	N/A
Existing Fill ¹	3 to 6	Uncontrolled fill comprised of lean clay, gravelly lean clay, and sand and gravel.	Variable
Upper Soils	15 to 30 ²	Lean clay, fat clay, sandy lean clay, clayey sand	Cohesive: Typically, stiff to hard with some zones of very soft to medium stiff
			Cohesionless: Lose to medium dense
Lower	15 to 36.2 ³	Sandy silt, silt, silty sand, sand, sand and gravel	Cohesive: Very soft to medium stiff
Soils			Cohesionless: Typically, medium dense to dense
Bedrock	All other test borings terminated in this stratum	Limestone with some shale.	Medium strong

- 1. Only encountered at test borings B-108, B-205, B-206, B-208.
- 2. Test borings B-102, B-105, B-109 to B-113, B-201 to B-207, B-209, B-210, B-215, and B-216 terminated in this stratum.
- 3. Test borings B-103, B-106, and B-208 terminated in this stratum.

Conditions encountered at each boring location are indicated on the individual boring logs shown in the **Exploration Results** section and are attached to this report. Stratification boundaries on the boring logs represent the approximate location of changes in native soil types; in situ, the transition between materials may be gradual.

Groundwater Conditions

The boreholes were observed while drilling and after completion for the presence and level of groundwater. The water levels observed in the boreholes can be found on the boring logs in **Exploration Results** and are summarized below.

DuPont Gravity Sewer and Pump Station ■ Chattanooga, Tennessee October 26, 2018 ■ Terracon Project No. E2175151

Boring Number	Approximate Depth to Groundwater while Drilling (feet) ¹	Approximate Depth to Groundwater after Drilling (feet) ¹	
B-101	31 (el. 623)	Not encountered	
B-106	27 (el.625)	Not encountered	
B-107	27 (el.625)	Not encountered	
B-108	26 (el.626)	Not encountered	
Below ground surface			

Groundwater was not observed in the remaining borings while drilling, or for the short duration the borings could remain open. However, this does not necessarily mean the borings terminated above groundwater, or the water levels summarized above are stable groundwater levels. A relatively long period may be necessary for a groundwater level to develop and stabilize in a borehole. Long term observations in piezometers or observation wells sealed from the influence of surface water are often required to define groundwater levels in materials of this type.

Groundwater level fluctuations occur due to seasonal variations in the amount of rainfall, runoff and other factors not evident at the time the borings were performed. Therefore, groundwater levels during construction or at other times in the life of the structure may be higher or lower than the levels indicated on the boring logs. The possibility of groundwater level fluctuations should be considered when developing the design and construction plans for the project.

The project site is located just downstream of the Chickamauga Dam on the Tennessee River. The pool elevation of the Tennessee River at the project site is heavily dependent upon TVA's management of the Tennessee River at the upstream dam and downstream Nickajack Dam. However, the Tennessee River pool elevation is generally between 630 and 640 feet, MSL under normal circumstances. According to NOAA, flood stage is at Elevation 651 feet.

GENERAL COMMENTS

As the project progresses, we address assumptions by incorporating information provided by the design team, if any. Revised project information that reflects actual conditions important to our services is reflected in the final report. The design team should collaborate with Terracon to confirm these assumptions and to prepare the final design plans and specifications. This facilitates the incorporation of our opinions related to implementation of our geotechnical recommendations. Any information conveyed prior to the final report is for informational purposes only and should not be considered or used for decision-making purposes.

Our analysis and opinions are based upon our understanding of the project, the geotechnical conditions in the area, and the data obtained from our site exploration. Natural variations will occur between exploration point locations or due to the modifying effects of construction or weather.

DuPont Gravity Sewer and Pump Station ■ Chattanooga, Tennessee October 26, 2018 ■ Terracon Project No. E2175151

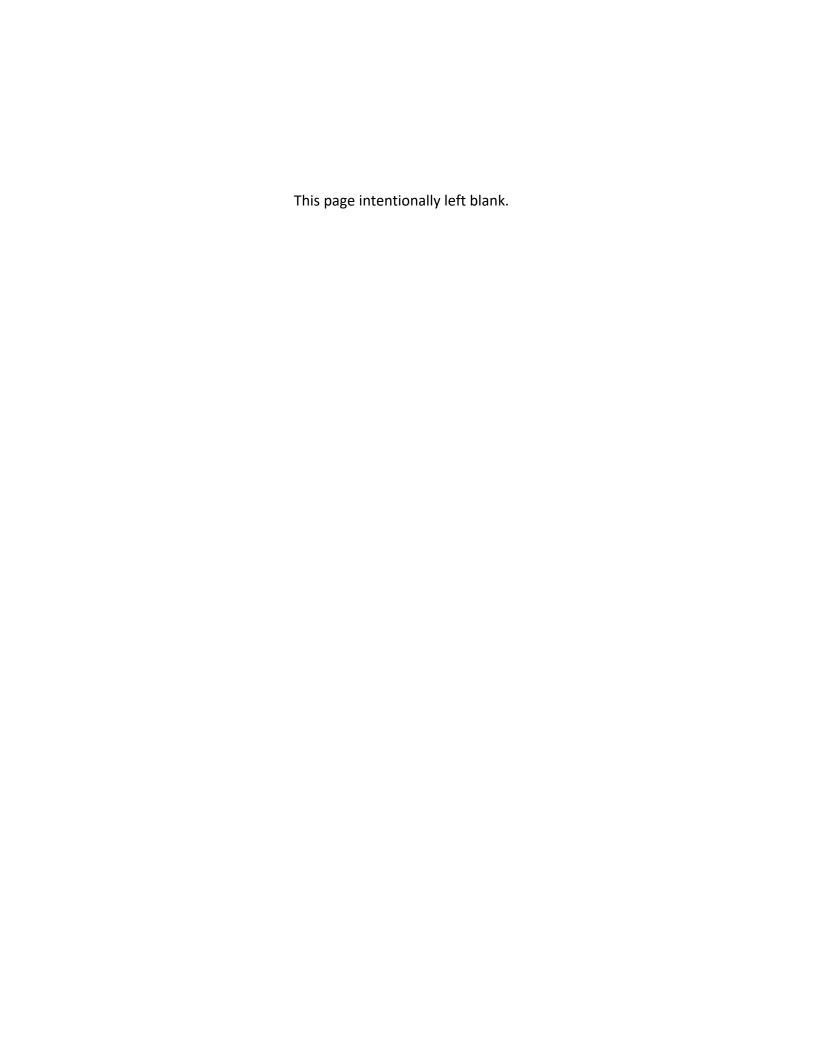

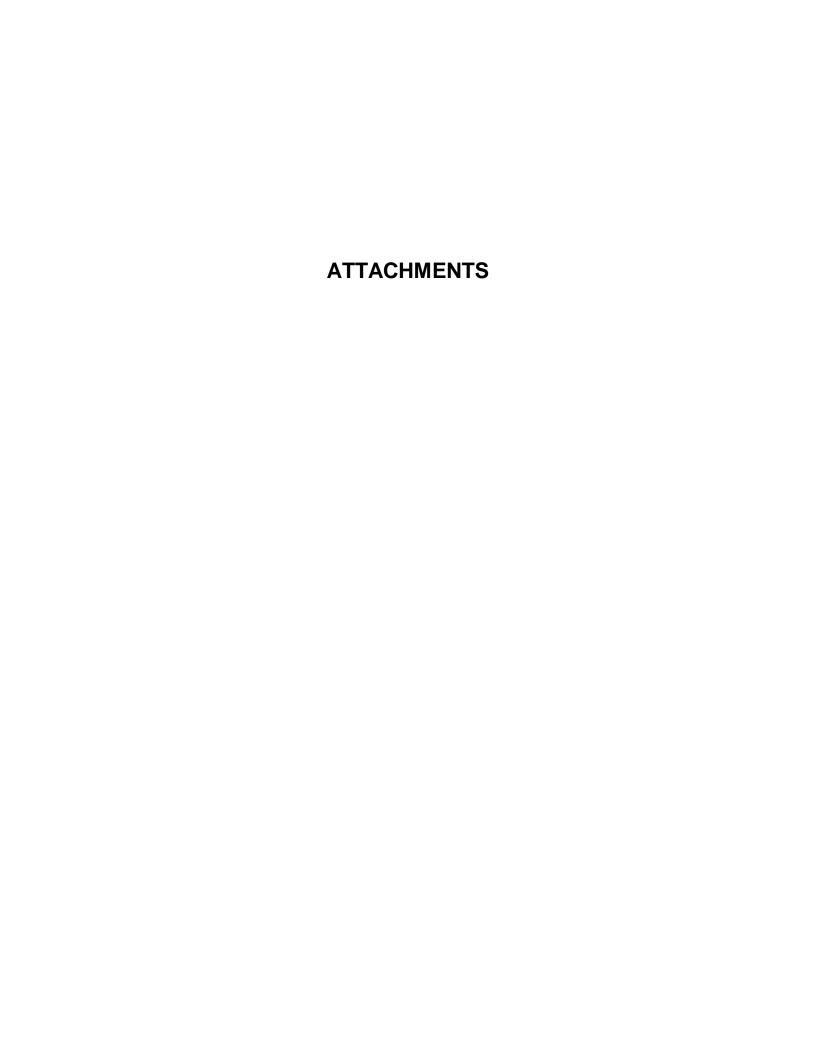

The nature and extent of such variations may not become evident until during or after construction. Terracon should be retained as the Geotechnical Engineer, where noted in the final report, to provide observation and testing services during pertinent construction phases. If variations appear, we can provide further evaluation and supplemental recommendations. If variations are noted in the absence of our observation and testing services on-site, we should be immediately notified so that we can provide evaluation and supplemental recommendations.

Our scope of services does not include either specifically or by implication any environmental or biological (e.g., mold, fungi, bacteria) assessment of the site or identification or prevention of pollutants, hazardous materials or conditions. If the owner is concerned about the potential for such contamination or pollution, other studies should be undertaken.

Our services and any correspondence or collaboration through this system are intended for the sole benefit and exclusive use of our client for specific application to the project discussed and are accomplished in accordance with generally accepted geotechnical engineering practices with no third party beneficiaries intended. Any third party access to services or correspondence is solely for information purposes to support the services provided by Terracon to our client. Reliance upon the services and any work product is limited to our client, and is not intended for third parties. Any use or reliance of the provided information by third parties is done solely at their own risk. No warranties, either express or implied, are intended or made.

Site characteristics as provided are for design purposes and not to estimate excavation cost. Any use of our report in that regard is done at the sole risk of the excavating cost estimator as there may be variations on the site that are not apparent in the data that could significantly impact excavation cost. Any parties charged with estimating excavation costs should seek their own site characterization for specific purposes to obtain the specific level of detail necessary for costing. Site safety, and cost estimating including, excavation support, and dewatering requirements/design are the responsibility of others. If changes in the nature, design, or location of the project are planned, our conclusions and recommendations shall not be considered valid unless we review the changes and either verify or modify our conclusions in writing.

DuPont Gravity Sewer and Pump Station ■ Chattanooga, Tennessee October 26, 2018 ■ Terracon Project No. E2175151

EXPLORATION AND TESTING PROCEDURES

Field Exploration

CDM Smith prescribed the following boring locations:

Number of Borings	Planned Boring Depth (feet) 1	Planned Location	
8	30 to 60 feet	Pump Station, Diversion Structure, Electrical Building, and Generator	
(B-101 to B-108)			
2	20 feet	Manholes near Pump Station	
(B-109 and B-110)	20 1001		
3	15 feet	Parking Area	
(B-111 to B-113)	15 feet		
14	15 to 20 feet	Gravity Sewer Alignment	
(B-201 to B-210)	13 to 20 feet	(approximate 500-foot spacing)	
2	15 feet	Railroad crossing for gravity sewer	
(B-215 and B-216)	15 leet		

^{1.} Feet below the ground surface

Boring Layout and Elevations: Borings were staked and surveyed by CDM Smith.

Subsurface Exploration Procedures: We advanced soil borings with a track- or truck-mounted drill rig using continuous flight hollow stem augers. Four samples were obtained in the upper 10 feet of each boring and at intervals of 5 feet thereafter. Soil sampling was performed using split-barrel or thin-walled sampling procedures. In the thin-walled tube sampling procedure, a thin-walled, seamless steel tube with a sharp cutting edge is pushed hydraulically into the soil to obtain a relatively undisturbed sample. A standard 2-inch outer diameter split barrel sampling spoon is driven into the ground by a 140-pound automatic hammer falling a distance of 30 inches. The number of blows required to advance the sampling spoon the last 12 inches of a normal 18-inch penetration is recorded as the Standard Penetration Test (SPT) resistance value. The SPT resistance values, also referred to as N-values, are indicated on the boring logs at the test depths. The samples were placed in appropriate containers, taken to our soil laboratory for testing, and classified by a geotechnical engineer.

Test borings B-101, B-104, and B-108 extended to auger refusal. Upon encountering bedrock or refusal-to-drilling conditions at these locations, rock coring (using NQ2 rock core barrel) was performed.

Our exploration team prepared field boring logs as part of standard drilling operations including sampling depths, penetration distances, and other relevant sampling information. Field logs include

DuPont Gravity Sewer and Pump Station ■ Chattanooga, Tennessee October 26, 2018 ■ Terracon Project No. E2175151

visual classifications of materials encountered during drilling, and our interpretation of subsurface conditions between samples. Final boring logs, prepared from field logs, represent the geotechnical engineer's interpretation, and include modifications based on observations and laboratory tests.

Laboratory Testing

CDM Smith provided Terracon with the laboratory testing assignments for the sampled soil and rock strata. Procedural standards noted below are for reference to methodology in general. In some cases, local practices and professional judgement require method variations. Standards noted below include reference to other related standards. Such references are not necessarily applicable to describe the specific test performed.

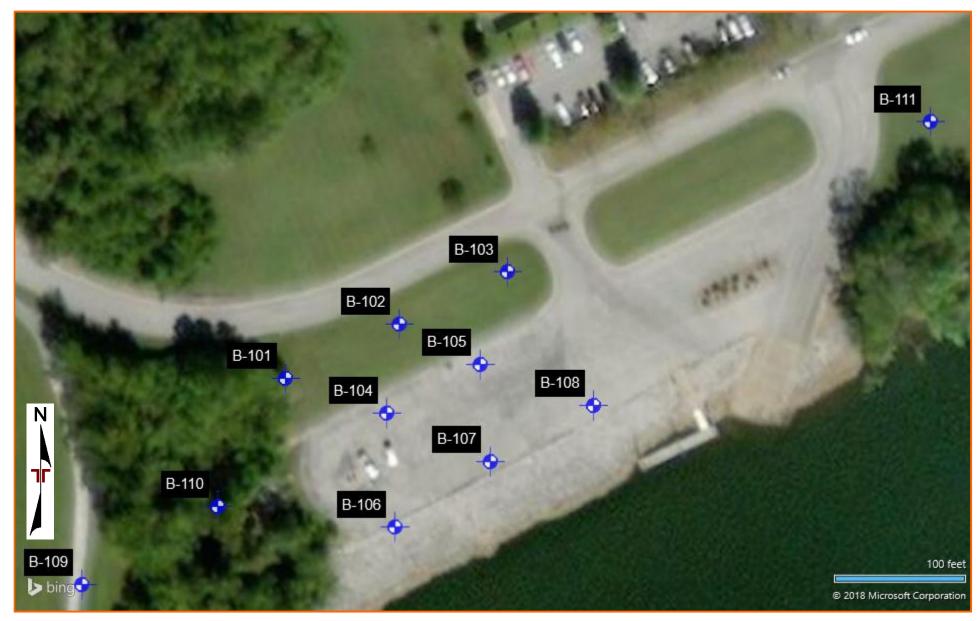

- ASTM D2216 Standard Test Methods for Laboratory Determination of Water (Moisture)
 Content of Soil and Rock by Mass
- ASTM D4318 Standard Test Methods for Liquid Limit, Plastic Limit, and Plasticity Index of Soils
- ASTM D422 Standard Test Method for Particle-Size Analysis of Soils
- ASTM D2435/D2435M Standard Test Methods for One-Dimensional Consolidation Properties of Soils Using Incremental Loading
- ASTM D4767 Standard Test Method for Consolidated Undrained Triaxial Compression Test for Cohesive Soils (3 point test)
- ASTM D7012 Standard Test Methods for Compressive Strength and Elastic Moduli of Intact Rock Core Specimens under Varying States of Stress and Temperature – Method C

DESCRIPTIVE SOIL CLASSIFICATION

Soil classification is based on the Unified Soil Classification System. Coarse Grained Soils have more than 50% of their dry weight retained on a #200 sieve; their principal descriptors are: boulders, cobbles, gravel or sand. Fine Grained Soils have less than 50% of their dry weight retained on a #200 sieve; they are principally described as clays if they are plastic, and silts if they are slightly plastic or non-plastic. Major constituents may be added as modifiers and minor constituents may be added according to the relative proportions based on grain size. In addition to gradation, coarse-grained soils are defined on the basis of their in-place relative density and fine-grained soils on the basis of their consistency.

LOCATION AND ELEVATION NOTES

Unless otherwise noted, Latitude and Longitude are approximately determined using a hand-held GPS device. The accuracy of such devices is variable. Surface elevation data annotated with +/- indicates that no actual topographical survey was conducted to confirm the surface elevation. Instead, the surface elevation was approximately determined from topographic maps of the area.

		Organic.	Liquid limit - not dried	< 0.75	ОП	Organic silt K, L, M, Q
Highly organic soils:	Primarily	organic matter, dark in co	olor, and organic odor		PT	Peat

- A Based on the material passing the 3-inch (75-mm) sieve
- B If field sample contained cobbles or boulders, or both, add "with cobbles or boulders, or both" to group name.
- Gravels with 5 to 12% fines require dual symbols: GW-GM well-graded gravel with silt, GW-GC well-graded gravel with clay, GP-GM poorly graded gravel with silt, GP-GC poorly graded gravel with clay.
- D Sands with 5 to 12% fines require dual symbols: SW-SM well-graded sand with silt, SW-SC well-graded sand with clay, SP-SM poorly graded sand with silt, SP-SC poorly graded sand with clay

E
$$Cu = D_{60}/D_{10}$$
 $Cc = \frac{(D_{30})^2}{D_{10} \times D_{60}}$

- F If soil contains ³ 15% sand, add "with sand" to group name.
- ^G If fines classify as CL-ML, use dual symbol GC-GM, or SC-SM.

- HIf fines are organic, add "with organic fines" to group name.
- If soil contains ³ 15% gravel, add "with gravel" to group name.
- J If Atterberg limits plot in shaded area, soil is a CL-ML, silty clay. J
- K If soil contains 15 to 29% plus No. 200, add "with sand" or "with gravel," whichever is predominant.
- L If soil contains ³ 30% plus No. 200 predominantly sand, add "sandy" to group name.
- $^{\mbox{\scriptsize M}}\mbox{If soil contains }^{3}$ 30% plus No. 200, predominantly gravel, add "gravelly" to group name.
- NPI 3 4 and plots on or above "A" line.
- OPI < 4 or plots below "A" line.
- P PI plots on or above "A" line.
- ^QPI plots below "A" line.

DESCRIPTION OF ROCK PROPERTIES

DuPont Gravity Sewer and Pump Station ■ Chattanooga, Tennessee
October 26, 2018 ■ Terracon Project No. E2175151

	WEATHERING
Term	Description
Unweathered	No visible sign of rock material weathering, perhaps slight discoloration on major discontinuity surfaces.
Slightly weathered	Discoloration indicates weathering of rock material and discontinuity surfaces. All the rock material may be discolored by weathering and may be somewhat weaker externally than in its fresh condition.
Moderately weathered	Less than half of the rock material is decomposed and/or disintegrated to a soil. Fresh or discolored rock is present either as a continuous framework or as corestones.
Highly weathered	More than half of the rock material is decomposed and/or disintegrated to a soil. Fresh or discolored rock is present either as a discontinuous framework or as corestones.
Completely weathered	All rock material is decomposed and/or disintegrated to soil. The original mass structure is still largely intact.
Residual soil	All rock material is converted to soil. The mass structure and material fabric are destroyed. There is a large change in volume, but the soil has not been significantly transported.

STRENGTH OR HARDNESS						
Description	Field Identification	Uniaxial Compressive Strength, psi (MPa)				
Extremely weak	Indented by thumbnail	40-150 (0.3-1)				
Very weak	Crumbles under firm blows with point of geological hammer, can be peeled by a pocket knife	150-700 (1-5)				
Weak rock	Can be peeled by a pocket knife with difficulty, shallow indentations made by firm blow with point of geological hammer	700-4,000 (5-30)				
Medium strong	Cannot be scraped or peeled with a pocket knife, specimen can be fractured with single firm blow of geological hammer	4,000-7,000 (30-50)				
Strong rock	Specimen requires more than one blow of geological hammer to fracture it	7,000-15,000 (50-100)				
Very strong	Specimen requires many blows of geological hammer to fracture it	15,000-36,000 (100-250)				
Extremely strong	Specimen can only be chipped with geological hammer	>36,000 (>250)				

	DISCONTINUITY DESCRIPTION								
Fracture Spacing (Joint	s, Faults, Other Fractures)	Bedding Spacing (May Include Foliation or Banding)							
Description	Spacing	Description	Spacing						
Extremely close	< ¾ in (<19 mm)	Laminated	< ½ in (<12 mm)						
Very close	3/4 in - 2-1/2 in (19 - 60 mm)	Very thin	½ in – 2 in (12 – 50 mm)						
Close	2-1/2 in – 8 in (60 – 200 mm)	Thin	2 in – 1 ft. (50 – 300 mm)						
Moderate	8 in – 2 ft. (200 – 600 mm)	Medium	1 ft. – 3 ft. (300 – 900 mm)						
Wide	2 ft. – 6 ft. (600 mm – 2.0 m)	Thick	3 ft. – 10 ft. (900 mm – 3 m)						
Very Wide	6 ft. – 20 ft. (2.0 – 6 m)	Massive	> 10 ft. (3 m)						

<u>Discontinuity Orientation (Angle)</u>: Measure the angle of discontinuity relative to a plane perpendicular to the longitudinal axis of the core. (For most cases, the core axis is vertical; therefore, the plane perpendicular to the core axis is horizontal.) For example, a horizontal bedding plane would have a 0-degree angle.

ROCK QUALITY DESIGNATION (RQD) 1						
Description	RQD Value (%)					
Very Poor	0 - 25					
Poor	25 – 50					
Fair	50 – 75					
Good	75 – 90					
Excellent	90 - 100					

The combined length of all sound and intact core segments equal to or greater than 4 inches in length, expressed as a percentage of the total core run length.

Report for Geophysical Services

October 12, 2018

CDM Smith 4600 Park Rd #240 Charlotte, North Carolina 28209

Attention: Mr. Erdem Onur Tastan, Ph.D., P.E.

Reference: Report for Geophysical Services

DuPont Pump Station and Basin Improvements Phase 2

Chattanooga, Tennessee S&ME Project No. 1281-18-061

Dear Mr. Tastan:

S&ME, Inc. (S&ME) has performed geophysical services at the above referenced site located in Chattanooga, Tennessee. These services were performed in general accordance with S&ME Proposal No. 121800346 dated August 15, 2018.

Project Information

CDM Smith is performing consulting services for a proposed new pump station facility within the existing boat ramp area located on Dixie Drive in Chattanooga, Tennessee (**Figure 1**). During the test boring program conducted by CDM Smith for the proposed facility, an approximate 11-foot vertical void was encountered in one of the borings (B-108). Depth to the top of rock at B-108 is about 33 feet below ground surface (bgs) with the encountered top of the void at about 45 feet bgs. The water table is just above the soil/rock interface, so the void is anticipated to be water-filled. The site is mostly covered by asphalt pavement with two sewer utilities (30 inch and 36 inches in diameter) running east-west across the site at about 5 feet bgs and electrical lines for the existing light poles. CDM Smith requested S&ME provide geophysical services within the areas of the proposed facility in an effort to identify potential karst features such as voids, bedrock joints/fractures, etc.

Methodology and Field Services

On October 3 and 4, 2018, S&ME completed an Electrical Resistivity Tomography (ERT) survey within the accessible portions of the site. ERT is an active geophysical technique that involves the introduction of a known amount of current into the ground and measuring the response in order to identify variations in subsurface electrical potentials. By introducing a known amount of current into the ground, the measured voltage potential at the surface is used to calculate the resistivity of a particular volume of subsurface media.

In general, clayey and moist soils result in lower resistivity (higher conductivity) readings, while dry sands, gravels, chert, and competent limestone/dolomite exhibit higher resistivity values. The resistivity of materials also partially depends on the substance filling its pore or void space. If a cavity or fracture is air-filled, a highly resistive anomaly within the limestone/dolomite unit is expected. If it is water- or clay-filled, an anomaly more conductive than the surrounding limestone/dolomite unit is expected. Natural variations in porosity and grain size

Chattanooga, Tennessee S&ME Project No. 1281-18-061

distribution can also cause such anomalies. It is important to note that actual ground resistivity is not collected during a resistivity survey. The survey is used to collect the apparent resistivity of a volume of material that is dependent upon electrode spacing. Actual resistivities are later determined through a data inversion process.

The ERT method requires that a series of small current and potential stainless-steel electrodes be inserted into the ground and data collected using various array configurations (Dipole-Dipole, Wenner, etc.). The electrodes are connected to a transmitter/recording instrument (resistivity meter) that generates the induced current and stores the resulting measurements for later processing and analysis. The configuration of the collected data (array) is dependent on the objectives of the investigation (e.g., vertical soil and bedrock profiling, cavity detection, fracture mapping, etc.). ERT measurements are acquired from the voltage potential difference measured between two electrodes and are dependent upon the distance between the electrodes. Material included between the electrodes is essentially averaged. Therefore, limitations of this method exist dependent upon the resolution of data acquisition needed versus the depth of a target.

We used an AGI SuperStingTM R8/IP resistivity system configured with 56 electrodes in general accordance with ASTM D6431-99 (2010) "Using DC Resistivity for Subsurface Investigations". A total of three ERT profiles at 275 feet in length were collected at the site using the Dipole-Dipole array configuration (**Figure 2**). Line locations were generally based site access and to avoid potential influence from the existing buried utilities. However, the beginnings of Lines 2 and 3 were slightly shortened due to shallow interference identified during data processing which may be related to the buried electrical lines. Electrodes for each profile were spaced at 5 feet. Due to the presence of asphalt pavements, 1/2 inch diameter holes were required at each electrode location in order for the electrodes to be inserted directly into the underlying soils. Each hole was backfilled with a flowable asphalt sealant at the end of the survey. The ERT data was processed using AGI's EarthImager 2D software and Golden Software's Surfer® was used to grid and plot the data. Elevations used for our models were based on provided plans and not actual field survey measurements performed by S&ME and should be considered approximate. ERT data profiles are presented in **Figure 2**.

Results

The ERT results depicted in **Figure 2** indicate a varying resistivity contrast across the surveyed area that range from approximately 10 ohm-meters (ohm/m) to 200 ohm/m. Presented depths of the ERT profiles are at about 60 feet below ground surface (bgs).

- In general, the ERT profiles exhibit two layers (Layer 1 and 2). The upper Layer 1 is primarily characterized by conductive material less than about 50 ohm/m and the lower. Layer 2 generally consists of material greater than about 50 ohm/m with the interpreted upper surface about 5 to 15 feet bgs. Based on the provided borings, Layer 1 is related to the soil overburden and Layer 2 is related to limestone bedrock.
- Two anomalous subsurface features were also identified in the ERT data sets (Anomalies A and B).
- Anomaly A is characterized by a conductive area within the interpreted bedrock (Layer 2) and was
 identified along each of the three profiles. The east-west trending anomaly is consistent with possible
 water/clay-filled voids, joints, and/or fractures within the bedrock.
- Anomaly B appears to be generally characterized by a topographic low along the surface of the
 interpreted bedrock along Line 2. However, the interpreted bedrock within this feature also exhibits
 relatively lower resistivity values that may be related to water/clay-filled voids, joints, and/or fractures.

October 12, 2018 2

Chattanooga, Tennessee S&ME Project No. 1281-18-061

Limitations

The geophysical method used for this survey has inherent limitations. Buried site metallic features (e.g., utilities, etc.) and overhead transmission lines can produce excessive noise and/or false responses in ERT data. As such, ERT profile locations are generally positioned where possible influence is limited. Depth of exploration for an ERT survey is limited by the allowable length of the collected data profile. Limiting factors due to site constraints such as property boundaries, surficial obstructions, utilities, etc. can reduce profile lengths. Regardless of the thoroughness of a geophysical study, there is always a possibility that actual conditions may not match the interpretations. The results should be considered accurate only to the degree implied by the methods used and the method's limitations and data coverage. Accordingly, the possibility exists that not all features at a project site will be located due to either subsurface soil conditions or the occurrence of features outside the lateral limits and below the depth of penetration of the methods used. As with most surface geophysical methods, resolution of the subsurface will also decrease with depth. As such, the size and/or contrast of subsurface features compared to the imaged subsurface media must be significant enough to produce the anticipated response. The location and/or determination (or the lack thereof) of subsurface features was based on our review of provided information and of the geophysical survey. Under no circumstances will S&ME assume any responsibility for damages resulting from the presence of subsurface features that may exist but were not identified by our survey.

Closure

S&ME appreciates the opportunity to assist you during this phase of the project. If you should have any questions concerning this report or if we may be of further assistance, please contact us.

Sincerely,

S&ME, Inc.

Dear Mr. Tastan:

S&ME, Inc. (S&ME) has performed geophysical services at the above referenced site located in Chattanooga, Tennessee. These services were performed in general accordance with S&ME Proposal No. 121800346CO1 dated January 9, 2019. This report has been revised based on comments in an email from CDM Smith on January 30, 2019.

Project Information

CDM Smith is performing consulting services for a proposed new pump station facility located near Dixie Drive in Chattanooga, Tennessee (**Figure 1**). During the test boring program conducted by CDM Smith for the original location of the proposed facility, an approximate 11-foot vertical void was encountered in one of the borings (B-108). Depth to the top of rock at B-108 is about 33 feet below ground surface (bgs) with the encountered top of the void at about 45 feet bgs. The water table is just above the soil/rock interface so the encountered void is likely water-filled. S&ME previously performed geophysical services within the original proposed area and identified potential karst features such as voids and bedrock joints/fractures. CDM Smith requested S&ME provide additional geophysical services at three alternative sites for the proposed facility (Sites A, B, and D).

Methodology and Field Services

Between October 3, 2018 and January 17, 2018, S&ME completed Electrical Resistivity Tomography (ERT) surveys within the accessible portions of the original site and Sites A, B, and D (**Figure 2**). ERT is an active geophysical technique that involves the introduction of a known amount of current into the ground and measuring the response in order to identify varying electrical potentials in subsurface material. By introducing a known amount of current into the ground, the measured voltage potential at the surface is used to calculate the resistivity of a particular volume of subsurface media.

In general, clayey and moist soils result in lower resistivity (higher conductivity) readings, while dry sands, gravels, chert, and competent limestone/dolomite exhibit higher resistivity values. The resistivity of materials also partially depends on the substance filling its pore or void space. If a cavity or fracture is air-filled, a highly resistive anomaly within the limestone/dolomite unit is expected. If it is water- or clay-filled, an anomaly more conductive

Chattanooga, Tennessee S&ME Project No. 1281-18-061R2

than the surrounding limestone/dolomite unit is expected. Natural variations in porosity and grain size distribution can also cause such anomalies. It is important to note that actual ground resistivity is not collected during a resistivity survey. The survey is used to collect the apparent resistivity of a volume of material that is dependent upon electrode spacing. Actual resistivities are later determined through a data inversion process.

The ERT method requires that a series of small current and potential stainless-steel electrodes be inserted into the ground and data collected using various array configurations (Dipole-Dipole, Wenner, etc.). The electrodes are connected to a transmitter/recording instrument (resistivity meter) that generates the induced current and stores the resulting measurements for later processing and analysis. The configuration of the collected data (array) is dependent on the objectives of the investigation (e.g., vertical soil and bedrock profiling, cavity detection, fracture mapping, etc.). ERT measurements are acquired from the voltage potential difference measured between two electrodes and are dependent upon the distance between the electrodes. Material included between the electrodes is essentially averaged. Therefore, limitations of this method exist dependent upon the resolution of data acquisition needed versus the depth of a target.

An AGI SuperStingTM R8/IP resistivity system configured with 56 electrodes was used in general accordance with ASTM D6431-99 (2010) "Using DC Resistivity for Subsurface Investigations". A total of twelve (12) ERT profiles ranging between about 275 and 330 feet in length were collected using the Dipole-Dipole array configuration; Lines 1, 2, and 3 at the original site, Lines 4, 5, and 6 at Site B, Lines 7, 8, and 9 at Site D, and Lines 10, 11, and 12 at Site A (**Figure 2**). Line locations were generally based on site access and, if possible, to avoid potential influence from existing buried utilities. However, the beginnings of Lines 2 and 3, and the end of Line 12, were slightly shortened due to shallow interference identified during data processing which are likely related to buried electrical lines and/or structures within those areas. Electrodes for each profile were spaced at 5 feet. Where asphalt pavements were encountered, 1/2 inch diameter holes were required in order for the electrodes to be inserted directly into the underlying soils. Each drilled hole was backfilled with a flowable asphalt sealant at the end of the survey.

ERT data was processed using AGI's EarthImager 2D software and Golden Software's Surfer® was used to grid and plot the data. Elevations used for our models were based on provided plans from CDM Smith and/or from the Hamilton County GIS website rather than actual field survey measurements performed by S&ME and should be considered approximate. ERT data profiles are presented in **Figures 3 through 6**.

Results

The ERT results depicted in **Figure 3 through 6** indicate a varying resistivity contrast across the surveyed areas that generally range from approximately 10 ohm-meters (ohm-m) to 200 ohm-m. Presented depths of the ERT profiles are at about 40 to 60 feet below ground surface (bgs).

In general, the ERT profiles exhibit two layers (Layer 1 and 2). The upper Layer 1 is primarily characterized
by relatively conductive material less than about 50 ohm-m and the underlying Layer 2 generally consists
of material greater than about 50 ohm-m. Based on the provided borings, Layer 1 is interpreted to be
related to the soil overburden and Layer 2 is interpreted to be related to the limestone bedrock.

January 30, 2019 2

Chattanooga, Tennessee S&ME Project No. 1281-18-061R2

- Eight anomalous subsurface features were also identified in the ERT data sets (Anomalies A through H);
 Anomalies A and B at the original site, Anomaly C at Site B, Anomalies D and E at Site D, and Anomalies F,
 G, and H at Site A.
- Anomalies A, F, and G are characterized by conductive areas within the interpreted bedrock (Layer 2) and are consistent with possible water/clay-filled voids (A and F) and/or joints/fractures within the bedrock (G).
- Anomalies B, C, D, E, and H appear to be generally characterized by a topographic low along the surface
 of the interpreted bedrock. However, the interpreted bedrock within several of these features also exhibit
 relatively lower resistivity values that may be related to water/clay-filled voids, joints, and/or fractures (B
 and C).
- In addition, the buried structures located at the end of Line 11 and south of Line 6 may have influenced
 the ERT data sets. As such, Anomaly H may instead be associated with a buried structure and the higher
 conductivity values exhibited in Line 6 may have masked the actual subsurface conditions so potential
 features along Line 6 were not interpreted.
- Interpreted anomalies are also summarized in the table below.

Anomaly	Site	ERT Line	Description
Α	Original	1, 2 and 3	Possible water/clay-filled voids within the bedrock
В	Original	2	Topographic low along bedrock surface with possible joints/fractures
С	В	4 and 5	Topographic low along bedrock surface with possible joints/fractures
D	D	7	Topographic low along bedrock surface
Е	D	7	Topographic low along bedrock surface
F	А	12	Possible water/clay-filled voids within the bedrock
G	А	12	Possible joints/fractures within the bedrock
Н	А	11	Topographic low along bedrock surface (possibly influenced by buried structure)

Limitations

The geophysical method used for this survey has inherent limitations. Buried site metallic features (e.g., utilities, etc.) and overhead transmission lines can produce excessive noise and/or false responses in ERT data. As such, ERT profile locations are generally positioned where possible influence is limited. Depth of exploration for an ERT survey is limited by the allowable length of the collected data profile. Limiting factors due to site constraints such as property boundaries, surficial obstructions, utilities, etc. can reduce profile lengths. Regardless of the thoroughness of a geophysical study, there is always a possibility that actual conditions may not match the interpretations. The results should be considered accurate only to the degree implied by the methods used and the method's limitations and data coverage. Accordingly, the possibility exists that not all features at a project site will be located due to either subsurface soil conditions or the occurrence of features outside the lateral limits and below the depth of penetration of the methods used. As with most surface geophysical methods, resolution of the subsurface will also decrease with depth. As such, the size and/or contrast of subsurface features compared to the imaged subsurface media must be significant enough to produce the anticipated response. The location and/or determination (or the lack thereof) of subsurface features was based on our review of provided information and of the geophysical survey. Under no circumstances will S&ME assume any responsibility for damages resulting from the presence of subsurface features that may exist but were not identified by our survey.

S&ME Geotechnical Laboratory Testing Report

April 22, 2019

CDM Smith 4600 Park Road #240 Charlotte, North Carolina 28209

Attention:

Mr. Erdem Onur Tastan, Ph.D., P.E.

Reference:

Laboratory Testing Services Report

DuPont WTP

Chattanooga, Tennessee

S&ME Project No. 1281-18-061

Dear Mr. Tastan:

S&ME, Inc. provided drilling and laboratory testing services at the above referenced project. Services were performed in general accordance with the scope of services outlined in the Standard Form of Agreement between Engineer and Subcontractor for Drilling Services dated February 18, 2019. Attached you will find laboratory reports documenting the laboratory testing services performed.

Should you have any questions regarding this information, or if we can be of any further assistance, please contact us at your convenience.

Sincerely,

S&ME. Inc.

David Grass, PE Project Engineer

NOTES: Effective (as received) unit weight as determined by RTH 109-93.

Loading rates were selected to target reaching failure between 2 and 15 minutes.

Fest results for specimens not meeting the requirements of ASTM D4543-08^{c1} may differ from a test specimen that meets the requirements of ASTM D4543.

SHAPE KEY

ASTM D4543-08^{et} Standard Practice for Preparing Rock Core as Cylindrical Test Specimens and Verifying Conformance to Dimensional and Shape Tolerance Section 1.2 - "Rock is a complex engineering material that can vary greatly as a function of lithology, stress history, weathering, moisture content and chemistry, and other natural geologic processes. As such, it is not always possible to obtain or prepare rock core specimens that satisfy the desirable tolerances given in this practice. Most commonly, this situation presents itself with weaker, more porous, and poorly cemented rock types and rock types containing significant or weak (or both) structural been determined by trial that this is not possible, prepare the rock specimen to the closest tolerances practicable and consider this to be the best effort and report it as such and if allowable or necessary for the intended test, features. For these and other rock types which are difficult to prepare, all reasonable efforts shall be made to prepare a specimen in accordance with this practice and for the intended test procedure. However, when it has capping the ends of the specimen as discussed in this practice is permitted."

- Test specimen measurements met the desired shape tolerances of ASTM D4543-08^{et} (side straightness, end flatness & parallelism, and end perpendicularity to axis) ⋖
- Test specimen measurements met the desired shape tolerances of ASTM D4543-08⁶¹ for end flatness & parallelism, and end perpendicularity to axis. Specimen did not meet the desired tolerance for side straightness. Specimen prepared to closest tolerances practicable. Ω
- Test specimen measurements met the desired shape tolerances of ASTM D4543-08^{e1} for end flatness & parallelism. Specimen did not meet the desired tolerances for side straightness and end perpendicularity to axis. Specimen prepared to closest tolerances practicable. O
- Test specimen measurements met the desired shape tolerances of ASTM D4543-08^{et} for end flatness. Specimen did not meet the desired tolerances for side straightness, parallelism and end perpendicularity to axis. Specimen prepared to closest tolerances practicable. Ω
- Test specimen measurements met the desired shape tolerances of ASTM D4543-08^{e1} for end flatness and end perpendicularity to axis. Specimen did not meet the desired tolerance for side straightness and parallelism. Specimen prepared to closest tolerances practicable. ш
